File Handling in Python

def :- File Handling in Python is the process of performing operation like reading, writing & Managing files using built-in Function to store and retrieve data permanently

open a file → `file = open("kanish.txt", "r")`

Read a file → `content = file.read()`
`Print (content)`

write a file → `file = open("kanish.txt", "w")`
`file = write ("Hello, kanish")`

Append to a file → `File = open("kanish.txt", "a")`
`File = write ("New line")`

close a file. → `file.close()`

File modes :-

"r" → Read (default)

"w" → write

"a" → append

"x" → Create a new file

"b" → Binary mode.

Exception Handling / Error Handling

def :- Error Handling in python is a Mechanism to Handle runtime error using try and except blocks, allowing the program to continue execution without interruption

↳ error comes during the execution of a program (runtime)

- * Division By Zero

- * Invalid Input

- * File Not Found.

Example.

```
try :
```

```
    num = int(input("Enter number :"))
```

```
    Print (10/num)
```

```
except ZeroDivisionError :
```

```
    Print ("cannot divisible By zero")
```

```
except value error :
```

```
    Print ("Invalid Input")
```
